; Sequence 12482, Application U;
; Patent No. 6703491
; GENERAL INFORMATION:
; APPLICANT: Homburger et al.
APPLICANT: Homburger et al.
TITLE OF INVENTION: Nucleic acids and proteins of
FILE REFERENCE: File Reference: 7326-094
CURRENT APPLICATION NUMBER: US/09/270,767
CURRENT FILING DATE: 1999-03-17
NUMBER OF SEQ ID NOS: 62517
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 12482
LENGTH: 1887
TYPE: DNA
ORGANISM: Drosophila melanogaster

Clone from S. Wiemann, Molecular Genome Analysis, German Cancer Research Center (DKFZ); Email s.wiemann@dkfz-heidelberg.de; sequenced by DKFZ (German Cancer Research Center, Heidelberg/Germany) within the cDNA sequencing consortium of the German Genome Project. This clone (DKFZp434P2235) is available at the RZPD Deutsches Ressourcenzentrum fuer Genomforschung GmbH in Berlin, Germany. Please contact RZPD for ordering: http://www.rzpd.de/cgi-bin/products/cl.cgi?CloneID=DKFZp434P2235 Further information about the clone and the sequencing project is available at http://mips.gsf.de/projects/cdna/.

                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a new PRC17 polypeptide. The invention is useful for detecting cancer cells (such as prostate tissue, breast tissue, lung tissue, ovarian tissue) in a biological sample. The invention is further useful for monitoring the efficacy of a therapeutic treatment of a cancer (prostate cancer, ovarian cancer, lung cancer, breast cancer). The molecules of the invention are useful diagnostically or prognostically to detect diseases or conditions associated with altered PRC17 activity or expression relative to normal, for example cancer. The present nucleic acid sequence represents the human PRC17 protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 200

                                                                                                                                      US-10-071-838-2
                                                                                                                                                                                                                                                                                                                The present invention relates to novel proteins and their coding sequences (ADC37168-ADC37455), which activate nuclear factor kappa B (NF-kappaB). The proteins and their coding sequences are useful for treating a disease associated with NF-kappaB activation, such as inflammation, autoimmune diseases, cancers, infectious diseases, bone diseases, AIDS, neurodegenerative diseases, or ischaemic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nuclear factor kappa B; NF-kappaB; inflammation; autoimmune disecancer; infectious disease; bone disease; AIDS; neurodegenerative disease; ischaemic disorder; Antiinflammatory; Immunomodulator; Cytostatic; Antimicrobial; Osteopathic; Anti-HT Neuroprotective; Nootropic; Cardiant; Gene therapy; human; gene;

New human proliferation and apoptosis related protein polypeptides used for diagnosis, treatment and prevention of cell proliferative, immunological and reproductive disorders.

9; Page 117-118; 128pp; English.

The present sequence encodes a human proliferation and apoptosis related protein (PROAP). The polypeptides and polynucleotides can be used for the diagnosis, treatment and prevention of cell proliferative, immunological and reproductive disorders. Disorders associated with decreased expression or activity of include arteriosclerosis, cirrhosis, hepatitis, psoriasis, melanoma, lymphoma and cancers of the breast, brain and prostate, acquired immune deficiency syndrome (AIDS), allergies, anaemia, asthma, diabetes mellitus, osteoarthritis, endometriosis, uterine fibroids and disruptions of the menstrual cycle. Antibodies against PROAP can be use in diagnosis of disorders characterized by PROAP e.g. in ELISA (enzyme linked immunosorbent assays) and the polynucleotides may be used to detect and quantify gene expression in biopsied tissues. These techniques can also be used to monitor regulation of PROAP levels during intervention

New human proliferation and apoptosis related proteins and polynucleotides for diagnosing, preventing or treating disorders associated with aberrant protein expression, e.g. cancer, AIDS, atherosclerosis or infertility.

Claim S. **QES** IJ NO 31; 85pp; English.

The present invention relates to the human proliferation and apoptosis related protein (PROAP) and its encoding nucleic acid. The invention is useful for diagnosing, preventing or treating disorders associated with altered expression or activity of human PROAP, such as cell proliferative (e.g. cancer or atherosclerosis), immunological (e.g. acquired immunodeficiency syndrome (AIDS) or allergies) or reproductive (e.g. infertility) disorders. The invention is also be used in screening for drugs that may be used for treating or preventing the disorders mentioned above and in gene therapy. The present sequence is the human PROAP-12 protein encoding cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SXCCCCCXXX PT PT XX DRXX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel proteins and their coding sequences (ADC37168-ADC37455), which activate nuclear factor kappa B (NF-kappaB). The proteins and their coding sequences are useful for treating a disease associated with NF-kappaB activation, such as inflammation, autoimmune diseases, cancers, infectious diseases, bone diseases, AIDS, neurodegenerative diseases, or ischaemic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New purified protein that activates nuclear factor kappa B (NF-kappaB) useful for treating inflammation, autoimmune diseases, cancers, infectious diseases, bone diseases, AIDS, neurodegenerative diseases o ischemic disorders.

                                                                                                                                                                                                 US-10-071-838-2 (1-549)
                                                                                                                                                                                                                                                                                                                      This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence encodes a polypeptide described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids having the different human tissues,

The present invention describes an isolated tumour-associated antigenic target (TAT) nucleic acid comprising: (a) any of 4622 nucleotide compressions (see SEQ ID NO:1 to 4622); (b) the full-length coding region of complement of (a) or (b); (d) a sequence that has 80% complement of (a) or (b); (d) a sequence that has 80% comprising to (a) a sequence that hybridises to (a) comprisions (c). Also described: (1) an expression vector comprising the above nucleic acid; (2) a host cell comprising the above expression vector; (3) comprising: (a) an amino acid sequence encoded by any of the above nucleotide sequences; (b) an amino acid sequence encoded by the full-comprising the above nucleotide sequences; (c) a sequence comprising the above nucleotide sequences; (c) a sequence comprising the above polypeptide fused to a heterologous polypeptide; (6) an isolated antibody; (8) an isolated oligopeptide; (7) a process for producing the antibody; (8) an isolated oligopeptide that binds to the above polypeptide; (7) a process for producing the antibody; (8) an isolated oligopeptide that binds to the above polypeptide; (7AT)
                                                                                                                                                                                                                                                                                         New nucleic acid molecule and encoded polypeptide, for diagnosing, preventing or treating cell proliferative disorders such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                   (GETH )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Homo sapiens.
